

1. 匹配时增加了三个条件：对公司类型（LTD，CO等）、国家地区、缩写字符串是否被名称包含：  
如下：

#如果公司类型不同，就比较公司类型

```
match = [matchcp[i].append(0) for i in range(0,3)]
matchcp_new = [matchcp[i] for i in range(0,3)]
for cp_sy_n in matchcp_new:
    if uk_abbr[3] == cptype[cleaned_name.index(cp_sy_n[0])]:
        cp_sy_n[2] += 1
        matchcp_new = sorted(matchcp_new,
                               key=lambda
                               matchcp:matchcp[2]
                               ,reverse =True)
```

比较是否包含有缩写字段,如果有的话，把位置往前放

```
uk_abbr[2].split(' ')
for ub in uk_abbr[2]:
    if ub in matchcp:
        for i,j in zip(range(0,5,2),range(3)):
            if cptype[cleaned_name.index(matchcp[j][0])] ==
uk_abbr[3]:
                matchcp[j],matchcp[0] = matchcp[0],matchcp[j]

for i,j in zip(range(0,5,2),range(3)):
    Matchcpname.write(indexnow+1, i+2,
                        full_name[cleaned_name.index(matchcp[j][0])])
    Matchcpname.write(indexnow+1, i+3,
                        matchcp[j][1])
```
